

Hello,

As part of our recruitment process at **Helloprint**, we'd like to invite you to complete a short technical assignment. The goal is to understand how you approach test automation and how you think about quality.

Objective

Create automated **end-to-end (E2E) tests** for <https://www.helloprint.ie> using **Playwright with TypeScript or JavaScript (ES Modules)**.

Tasks

Part 1 – Directed Task

Implement an **end-to-end checkout flow** for any product of your choice on [helloprint.ie](https://www.helloprint.ie).

Your test should:

1. Navigate to the product page.
2. Configure/select product options (size, quantity, etc.).
3. Add the product to the cart.
4. Proceed to the checkout (stop before entering payment details).
5. Assert that:
 - The correct product and quantity are displayed in the cart.
 - Prices and totals are shown correctly.
 - The checkout page loads successfully with the order summary.

Requirements:

- Use **Playwright with TypeScript OR JavaScript (ESM)**.
 - Follow **best practices**
 - Run the test in **at least two languages** (English + one other available on the site except Dutch websites).
-

Part 2 – Open-Ended Task

Add **1–2 extra tests of your choice** for the site. These should reflect what *you* think is important in an ecommerce flow.

Please add a short file `TEST-NOTES.md` describing:

- Why did you choose these tests?
 - How would you prioritize them in a real CI/CD pipeline?
-

Deliverables

- A GitHub repo link (or a zip file) containing:
 - `/tests/e2e/checkout.spec.ts` or `.js` (main flow).
 - Any extra test files for Part 2.
 - `README.md` with setup + run instructions.
 - `TEST-NOTES.md` for your reasoning.
 - Playwright HTML report enabled.
-

Timebox

- Estimated effort: **2–3 hours**.
 - Please submit within **48 hours** of receiving the assignment.
-

Submission

Please send us a GitHub repo link (preferred) or a zip file with your solution.

Thanks a lot for your time and effort — we're looking forward to seeing your approach!
